Final Diagnosis (Verified)

Left ureter margin, biopsy with frozen section:
No tumor seen.

Right ureter margin, biopsy with frozen section:
No tumor seen.

Left pelvic lymph nodes, excision:
Three (3) benign lymph nodes with no evidence of metastatic neoplasm.

Right pelvic lymph nodes, excision:
Three (3) benign lymph nodes with no evidence of metastatic neoplasm.

Urinary bladder and prostate, resection:
Invasive high-grade urothelial carcinoma of urinary bladder.
Tumor is present on the right bladder wall and measures 1.6 cm in diameter.
Tumor invades deeply into muscularis propria and is focally present at the border between muscularis propria and underlying perivesical fat.
No evidence of lymphovascular invasion.
Negative perivesical soft tissue margin.
Benign prostatic tissue.
Negative seminal vesicles and vasa deferentia.
AJCC pathologic stage: T2b,N0.

Appendix, resection:
Negative incidental appendix.

Gross Description (Verified)

"FSA." All frozen section control tissue is submitted in "FSA."

"FSB." All frozen section control tissue is submitted in "FSB."

"Left pelvic lymph node." The specimen consists of a 6.5 x 5.5 x 3 cm aggregate of yellow-tan fatty tissue. On examination, 3 possible lymph nodes are identified. These range in size from 4 – 9 cm. "C1-C3," fragments, representative.

"Right pelvic lymph node package." The specimen consists of a 6.5 x 6 x 1.5 cm aggregate of yellow-tan fatty tissue. On examination, 3 possible lymph nodes are identified. These range in size from 1.7 – 3.5 cm. "D1-D3," fragments, representative.

"Bladder and prostate." The specimen consists of a 14 x 14 x 6.5 cm bladder and prostate with attached soft fatty tissue. The specimen has been opened along the anterior aspect. The posterior apex margin will be inked orange and the remaining prostate will be inked

Surg Path Final Report

* Final Report *

dome of the bladder is a 1.6 x 1.6 cm red-brown ulcerated mass. The soft tissue margin will be inked black. This mass does grossly appear to extend into but not beyond the bladder wall. This comes to within 1.5 cm from the inked soft tissue margin. The remaining bladder mucosa has a blue-gray edematous appearance.

The attached prostate measures 5.5 x 4 x 2.5 cm and will be inked black. On sectioning, the cut surface has a pale tan, slightly nodular appearance. There are 2 clear fluid-filled cystic spaces. The largest of these is 0.6 cm. No definite tumor is grossly appreciated within the prostate. "E1," left apex; "E2," right apex; "E3," left ureteral orifice; "E4," right ureteral orifice; "E5-E7," mass right side bladder; "E8," trigone; "E9," left side bladder; "E10," dome of bladder; "E11," left seminal vesicle and vas deferens; "E12," right seminal vesicle and vas deferens; "E13," left anterior prostate; "E14," left posterior prostate; "E15," right anterior prostate; "E16," right posterior prostate. Note: Please see attached drawing.

"Portion of appendix." The specimen consists of a 1.2 x 0.6 cm distal tip of the appendix. What remains of the serosa has a blue-gray appearance and is slightly hemorrhagic and focally charred. On sectioning, the lumen is filled with a small amount of fecal material. A definite fecalith is not identified. "F1," distal tip; "F2," margins, all.

Also received are project cassette labeled ind
